

Introduction to Computer Graphics

8. Buffers and Mapping techniques

I-Chen Lin

National Chiao Tung University

Textbook: E. Angel, D. Shreiner Interactive Computer Graphics, 6th Ed., Pearson

Ref: D.D. Hearn, M. P. Baker, W. Carithers, Computer Graphics with OpenGL, 4th Ed., Pearson

Outline

- ▶ Buffers
- ▶ Mapping techniques
- ▶ Anti-aliasing

Buffer

- Define a buffer by its spatial resolution ($n \times m$) and its depth (or precision) k , the number of bits/pixel

OpenGL Frame Buffer

Buffers

- ▶ Color buffers can be displayed
 - ▶ Front
 - ▶ Back
 - ▶
- ▶ Depth
- ▶ Accumulation
- ▶ Stencil

Writing in Buffers

- ▶ Conceptually, we can consider all of memory as a large two-dimensional array of pixels
- ▶ We read and write rectangular block of pixels
 - ▶ Bit block transfer (bitblt) operations
- ▶ The frame buffer is part of this memory

Writing Model

- Read destination pixel before writing source

Bit Writing Modes

- ▶ Source and destination bits are combined bitwise
- ▶ 16 possible functions (one per column in table)

[illegible]

Mapping Methods

- ▶ Texture Mapping
- ▶ Environment Mapping
- ▶ Normal and Bump Mapping

The Limits of Geometric Modeling

- ▶ Although graphics cards can render over 10 million polygons per second, the number is insufficient for many phenomena
 - ▶ Clouds
 - ▶ Grass
 - ▶ Terrain
 - ▶ Skin

Image from "Final Fantasy" movie

Modeling an Orange

- ▶ Consider the problem of modeling an orange (the fruit)
- ▶ Start with an orange-colored sphere
 - ▶ Too simple
- ▶ Replace sphere with a more complex shape
 - ▶ Does not capture surface characteristics (small dimples)
 - ▶ Takes too many polygons to model all the dimples

Modeling an Orange (cont.)

- ▶ Take a picture of a real orange, scan it, and “paste” onto simple geometric model
 - ▶ This process is known as *texture mapping*
- ▶ Still might not be sufficient because the resulting surface will be smooth
 - ▶ Need to change local shape
 - ▶ Bump mapping

Three Types of Mapping

- ▶ Texture Mapping

- ▶ Uses images to fill inside of polygons

- ▶ Environment (reflection mapping)

- ▶ Uses a picture of the environment for texture maps
 - ▶ Allows simulation of highly specular surfaces

- ▶ Bump mapping

- ▶ Emulates altering normal vectors during the rendering process

Texture Mapping

Geometric model

Texture-mapped

Environment Mapping

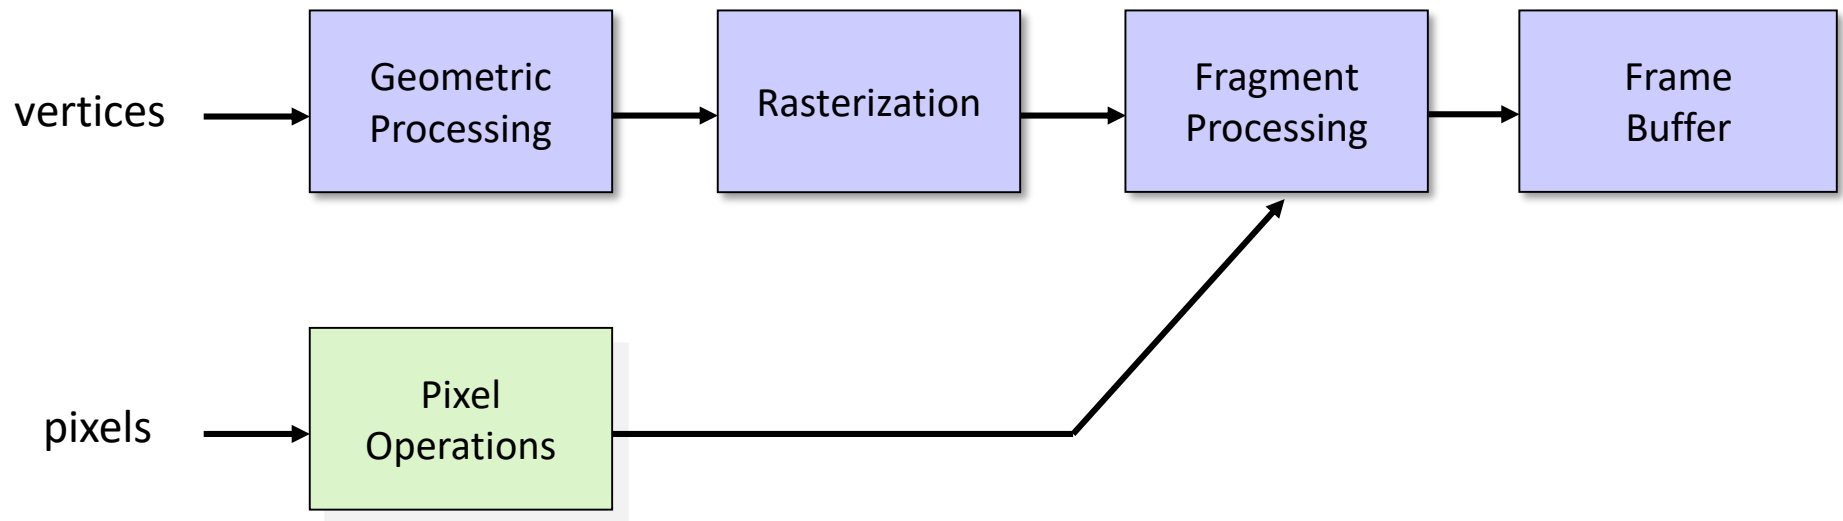

Bump Mapping

Where Does Mapping Take Place?

- ▶ Mapping techniques are implemented at the end of the rendering pipeline
 - ▶ Very efficient because few polygons make it past the clipper

Is it Simple?

- ▶ Although the idea is simple
 - ▶ map an image to a surface---there are 3 or 4 coordinate systems involved

2D image

3D surface

Coordinate Systems

- ▶ Parametric coordinates
 - ▶ May be used to model curves and surfaces
- ▶ Texture coordinates
 - ▶ Used to identify points in the image to be mapped
- ▶ Object or World Coordinates
 - ▶ Conceptually, where the mapping takes place
- ▶ Window Coordinates
 - ▶ Where the final image is really produced

Texture Mapping

Mapping Functions

- ▶ The basic problem is how to find the maps
- ▶ Consider mapping from texture coordinates to a point on a surface
- ▶ Appear to need three functions

- ▶ $x = x(s,t)$

- ▶ $y = y(s,t)$

- ▶ $z = z(s,t)$

- ▶ But we really want to go the other way

Backward Mapping

- ▶ We really want
 - ▶ Given a point on an object, we want to know to which point in the texture it corresponds
- ▶ Need a backward map of the form
 - ▶ $s = s(x, y, z)$
 - ▶ $t = t(x, y, z)$
- ▶ Such functions are difficult to find in general

Two-part Mapping

- ▶ One solution to the mapping problem is to first map the texture to a simple intermediate surface
 - ▶ Example: map to cylinder

Cylindrical Mapping

- ▶ parametric cylinder

- ▶ $x = r \cos 2\pi u$

- ▶ $y = r \sin 2\pi u$

- ▶ $z = v/h$

$u, v: 0 \sim 1$

- ▶ maps rectangle in u, v space to cylinder of radius r and height h in world coordinates

- ▶ $s = u$

- ▶ $t = v$

- ▶ maps from texture space

Spherical Map

- ▶ We can use a parametric sphere
 - ▶ $x = r \cos 2\pi u$
 - ▶ $y = r \sin 2\pi u \cos 2\pi v$
 - ▶ $z = r \sin 2\pi u \sin 2\pi v$
- ▶ in a similar manner to the cylinder but have to decide where to put the distortion
- ▶ *Spheres are used in environmental maps*

Box Mapping

- ▶ Easy to use with simple orthographic projection
- ▶ Also used in environment maps (Cube mapping)

Second Mapping

- ▶ Map from an intermediate object to an actual object
 - ▶ Normals from the intermediate to the actual
 - ▶ Normals from the actual to the intermediate
 - ▶ Vectors from the center of the intermediate

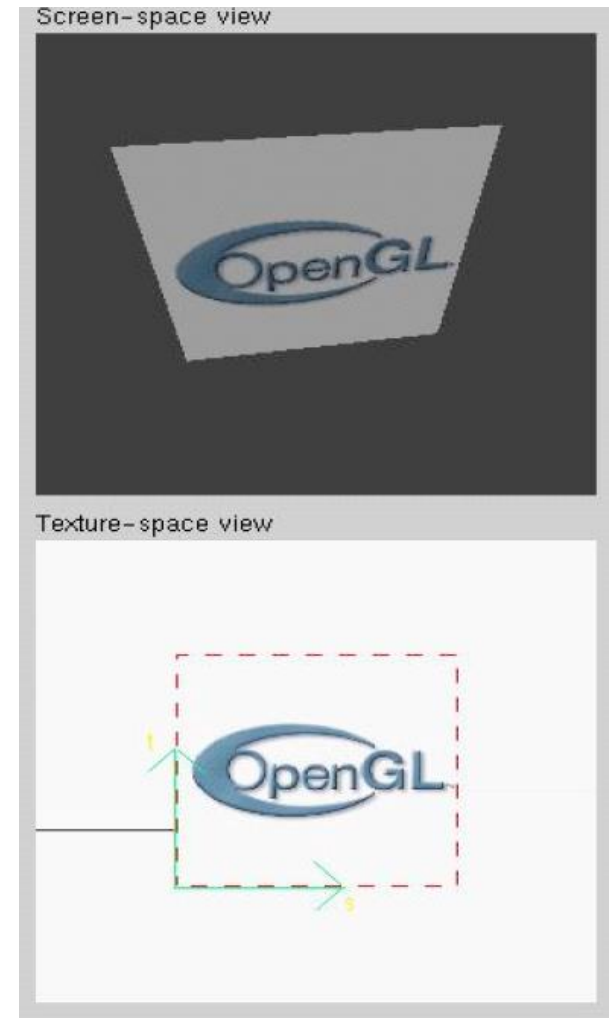

Two-part Mapping

Texture Example

- ▶ The texture (below) is a 256 x 256 image, mapped to a rectangular polygon which is viewed in perspective.
- ▶ OpenGL requires texture dimensions to be powers of 2

Texture Mapping

Texture Mapping for Polygons

- Based on parametric texture coordinates
 - `glTexCoord*()` specified at each vertex

Interpolation

- ▶ OpenGL uses interpolation to find proper texels from specified texture coordinates
 - ▶ Can be distortions

good selection
of tex coordinates

poor selection
of tex coordinates

texture stretched
over trapezoid
showing effects of
bilinear interpolation

Interpolation

- Can we just use Linear interpolation in screen space?

Pictures from lecture notes of “Computer Graphics”, UNC

Reduction of the flaws

- Subdivide the texture-mapped triangles into smaller triangles.

- Is it correct?

Screen Space vs. 3D space

► Interpolation in screen space

► $P(m) = P_1 + m(P_2 - P_1)$

► Interpolation in 3D space

► $V(n) = V_1 + n(V_2 - V_1)$

► $P_y(n) = V_y(n) / V_z(n)$

Mapping from Screen Space to 3D Space

$$P_y = \frac{y_1}{z_1} + m \left(\frac{y_2}{z_2} - \frac{y_1}{z_1} \right) = \frac{y_1 + n(y_2 - y_1)}{z_1 + n(z_2 - z_1)}$$

n in terms of ***m***

$$n = \frac{mz_1}{z_2 + m(z_1 - z_2)}$$

$$T(n) = T_1 + n(T_2 - T_1)$$

Magnification and Minification

- Minification

- More than one texel can cover a pixel

- Magnification

- More than one pixel can cover a texel

Texture

Polygon

Magnification

Texture

Polygon

Minification

point sampling (nearest texel) is the most efficient approach, but ...

Aliasing

Original image

Sample one for each 5x5 pixels

Ref: www.relisoft.com/Science/Graphics/alias.html

Aliasing

- Point sampling of the texture can lead to aliasing errors

point samples in texture space

point samples in u,v (or x,y,z) space

Re-sampling

- Resample the checkerboard by taking one sample at each circle.

Simple sampling, but ...

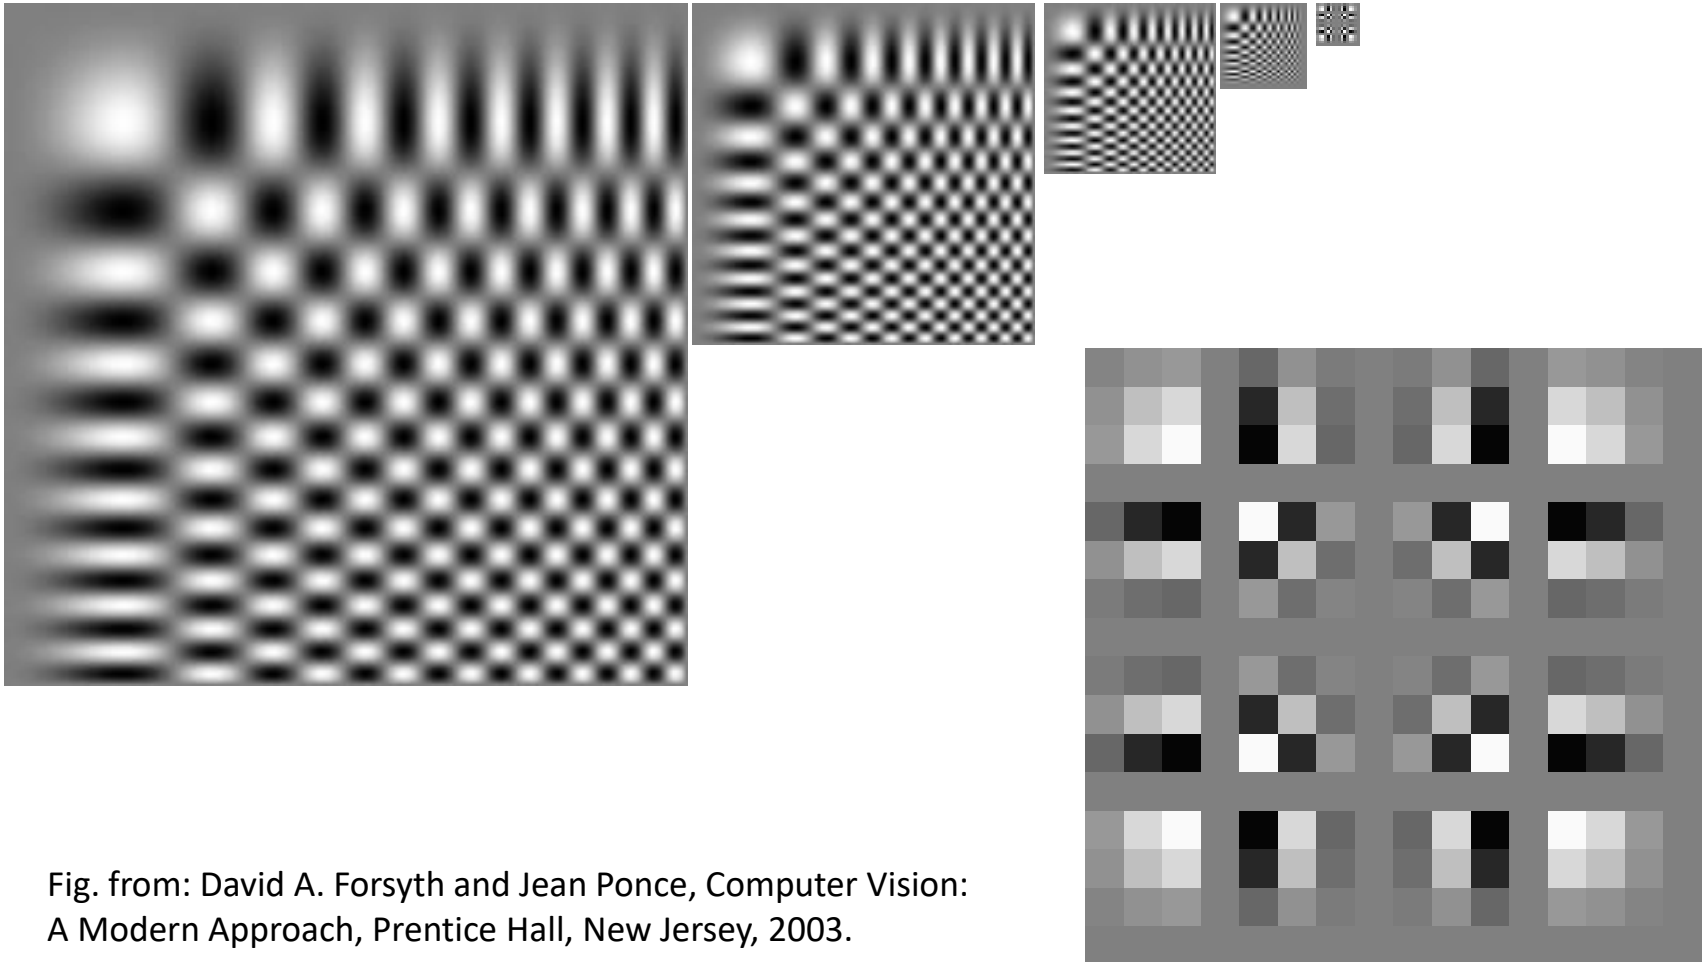

Fig. from: David A. Forsyth and Jean Ponce, Computer Vision: A Modern Approach, Prentice Hall, New Jersey, 2003.

Area Averaging

- A better but slower option is to use area averaging

Area Averaging

Original image

Applying a 5x5 box filter

Sampling every 5x5 pixels

Sampling every 5x5 pixels

Mipmapped Textures

- ▶ On-line processing or pre-filtering?
- ▶ Mipmapping allows for prefiltered texture maps of decreasing resolutions
- ▶ Lessens interpolation errors for smaller textured objects

MipMap

storage

Mipmapping

- 1/3 overhead of maintaining the MIP map.

Examples of Highly Reflected Models

T1000 from movie “Terminator 2”

Silver Surfer from movie “Fantastic 4: Rise of the Silver Surfer”

How to Handle Highly Specular Surfaces?

- ▶ How to render a flat mirror?
- ▶ How to render a mirror-like object in a virtual scene?
- ▶ How about rendering such an object in a real scene?

Environment Mapping

- ▶ For real-time applications
- ▶ A.k.a reflection mapping
- ▶ First proposed by Blinn and Newell.
- ▶ A efficient way to create reflections on curved surfaces
 - ▶ can be implemented using texture mapping supported by graphics hardware

Environment Mapping

- ▶ Assume the environment is far away and there's no self-reflection
- ▶ The reflection at a point can be solely decided by the reflection vector.

Environment Mapping

Box Map

Latitude Map

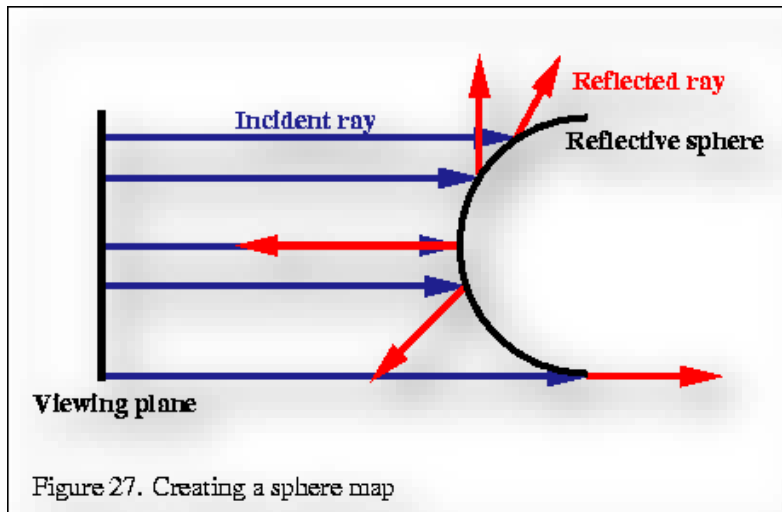

GL Map

Sphere Mapping

- ▶ The image texture is taken from a perfectly reflective sphere.
- ▶ Assume the size of the sphere $\rightarrow 0$. Map the rays to the environment
- ▶ Using orthogonal projection.

Sphere Mapping

- ▶ To access the sphere map texture

- ▶ Compute the reflection vector r on the object surface by e and n' .
 $(r = (r_x, r_y, r_z) = -e' + 2(n' \cdot e')n')$

- ▶ Access the texture: compute the sphere normal in the local space
 $n'' = (r_x, r_y, r_z) + (0, 0, -1)$

$$n''' = \left(\frac{r_x}{m}, \frac{r_y}{m}, \frac{r_z - 1}{m} \right) \quad m = \sqrt{r_x^2 + r_y^2 + (r_z - 1)^2}$$

- ▶ Normalized the screen space from $[-1, 1]$ to $[0, 1]$

$$s = \frac{r_x}{2m} + \frac{1}{2} \quad t = \frac{r_y}{2m} + \frac{1}{2}$$

- ▶ (s, t) is the target texture coordinate

Sphere Mapping

Samples from DirectX SDK

Bump and Normal Mapping

- Represent surface details and avoid heavy geometric computation.

http://www.ozone3d.net/tutorials/bump_mapping.php

Bump and Normal Mapping

- Calculate reflection (Phong Shading) with a normal map.
[normal mapping]
- Or with a height map. [bump mapping]

Smooth surface

Bumpy surface

Bump-mapped
surface

Bump Mapping

- ▶ Let $P = P(u,v)$ be a smooth parametric surface, with normals $N = N(u,v)$.
- ▶ Apply a bump map $b = b(u,v)$:

$$P' = P + bN$$

$$N' = P'_u \times P'_v$$

$$P'_u = \frac{\partial}{\partial u} (P + bN) = P_u + b_u N + bN_u \approx P_u + b_u N$$

$$P'_v = \frac{\partial}{\partial v} (P + bN) = P_v + b_v N + bN_v \approx P_v + b_v N$$

P_u – Tangent at P in u direction

P_v – Tangent at P in v direction

Bump Mapping (cont.)

$$\begin{aligned}N' &\approx (P_u + b_u N) \times (P_v + b_v N) \\&= P_u \times P_v + b_u (N \times P_v) + b_v (P_u \times N) + b_u b_v (N \times N) \\&= N + b_u (N \times P_v) + b_v (P_u \times N)\end{aligned}$$

E.g.

When $N = (0, 0, 1)$, $N \times P_v = (-1, 0, 0)$, $P_u \times N = (0, -1, 0)$,
 N' becomes $(-b_u, -b_v, 1)$

Compositing, Blending and Accumulation Buffer

Opacity and Transparency

- ▶ Opaque surfaces permit no light to pass through
- ▶ Transparent surfaces permit all light to pass
- ▶ Translucent surfaces pass some light
 - ▶ translucency = $1 - \text{opacity } (\alpha)$

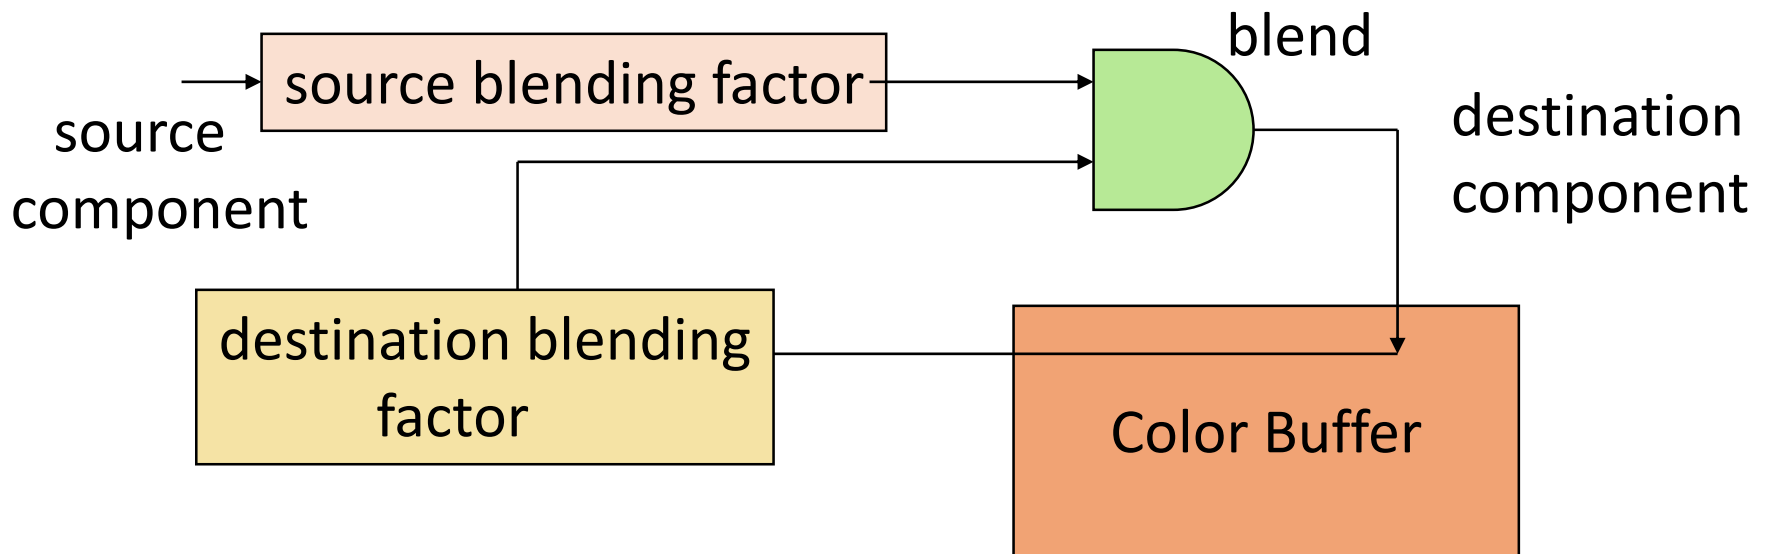

Physical Models

- ▶ Dealing with translucency in a physically correct manner is difficult due to
 - ▶ the complexity of the internal interactions of light and matter
 - ▶ Using a pipeline renderer

Writing Model

- ▶ Use A component of RGBA (or RGBA α) color to store opacity
- ▶ During rendering we can expand our writing model to use RGBA values

Blending Equation

- ▶ We can define source and destination blending factors for each RGBA component
 - ▶ $s = [s_r, s_g, s_b, s_\alpha]$
 - ▶ $d = [d_r, d_g, d_b, d_\alpha]$
- ▶ Suppose that the source and destination colors are
 - ▶ $b = [b_r, b_g, b_b, b_\alpha]$
 - ▶ $c = [c_r, c_g, c_b, c_\alpha]$
- ▶ Blend as
 - ▶ $c' = [b_r s_r + c_r d_r, b_g s_g + c_g d_g, b_b s_b + c_b d_b, b_\alpha s_\alpha + c_\alpha d_\alpha]$

Alpha Blending for Particles

Figure from: <http://www.gamedev.net/topic/592399-particle-visual-artifacts/>

Order Dependency

- ▶ Is this image correct?
 - ▶ Probably not
 - ▶ Polygons are rendered in the order they pass down the pipeline
 - ▶ Blending functions are order dependent

Opaque and Translucent Polygons

- ▶ Suppose that we have a group of polygons some of which are opaque and some translucent
- ▶ Opaque polygons block all polygons behind them and affect the depth buffer
- ▶ Translucent polygons should not affect depth buffer
 - ▶ Render with `glDepthMask(GL_FALSE)` which makes depth buffer read-only
- ▶ Sort polygons first to remove order dependency

Fog

- ▶ We can composite with a fixed color and have the blending factors depend on depth
 - ▶ Simulates a fog effect
 - ▶ Blend source color C_s and fog color C_f by
 - ▶ $C'_s = f C_s + (1-f) C_f$
- ▶ f is the *fog factor*
 - ▶ Exponential
 - ▶ Gaussian
 - ▶ Linear

Fog Functions

Figure from: <http://www.directxtutorial.com>

Accumulation Buffer

- ▶ Compositing and blending are limited by resolution of the frame buffer
 - ▶ Typically 8 bits per color component
- ▶ The accumulation buffer is a high resolution buffer
 - ▶ 16 or more bits per component
 - ▶ Write into it or read from it with a scale factor
- ▶ Slower than direct compositing into the frame buffer
- ▶ Now deprecated but can do techniques with floating point frame buffers

Applications

- ▶ Compositing
- ▶ Image Filtering
- ▶ Whole scene antialiasing
- ▶ Motion effects
- ▶
